

# Embedded Model Predictive Control

Philippe Weingertner

<https://youtu.be/PY0-h5LEUiY>

**Abstract**

We study methods for accelerating Model Predictive Control (MPC) solutions. Our project features:

- An efficient implementation of Accelerated Dual Gradient Projected algorithm (GPAD)
- An improvement over an existing GPAD algorithm
- A benchmark with off-the-shell Interior Point solvers on a constrained and ill-conditioned tracking MPC problem.

## Introduction

We formulate a convex-embedded MPC problem as follows:

$$\begin{aligned} \min_{x,u} \quad & \sum_{k=0}^{N-1} \left( x_{k+1}^T Q x_{k+1} + u_k^T R u_k \right) + x_N^T Q_N x_N \\ \text{s.t.} \quad & x_{k+1} = A x_k + B u_k + f \\ & F x_k + G u_k \leq d \\ & F_N x_N \leq d_N \\ & x_0 = x_{\text{init}} \end{aligned}$$

We rewrite the problem in the following form:

$$\begin{aligned} \underset{z}{\text{minimize}} \quad & \frac{1}{2} z^T H z \quad H \text{ is diagonal} \\ \text{s.t.} \quad & A_e z = b_e \quad A_e \text{ is sparse} \\ & A_i z \leq b_i \quad A_i \text{ is sparse} \end{aligned}$$

## AFTI-16 Model with reference tracking

### Example: AFTI-16

**Objective:** control *attack* and *pitch angle* of an AFTI-16 (Advanced Fighter Technology Integration)

$$u(t) = \begin{bmatrix} \delta_a(t) & \text{elevator angle (deg)} \\ \delta_f(t) & \text{flaperon angle (deg)} \end{bmatrix}$$

$$y(t) = \begin{bmatrix} \alpha(t) & \text{angle of attack (deg)} \\ \theta(t) & \text{pitch angle (deg)} \end{bmatrix}$$

**Challenges:**

- open-loop **unstable poles**
- saturated actuators

$$\dot{x}(t) = \begin{bmatrix} -0.0151 & -60.5651 & 0 & -32.174 \\ -0.001 & -1.3111 & 0.9929 & 0 \\ 0.00016 & 61.2511 & -0.99939 & 0 \\ 0 & 0 & 1 & 0 \end{bmatrix} x(t) + \begin{bmatrix} -2.516 & -13.136 \\ -0.1189 & -0.2113 \\ -17.251 & -1.5766 \\ 0 & 0 \end{bmatrix} u(t)$$

$$y(t) = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \end{bmatrix} x(t)$$

Eigenvalues of the LTI dynamics

$$\begin{bmatrix} -7.6636 & -0.0075 & \pm 0.0556j & 5.4530 \end{bmatrix}$$

- Linear control (=unconstrained MPC) + input clipping

$$W^y = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$$

unstable!

Saturation needs to be considered in the control design!

## Dual Projected Gradient Approach

We consider the Lagrangian and dual functions:

$$L(z, \lambda) = \frac{1}{2} z^T H z + \lambda^T (A_i z - b_i)$$

$$g(\lambda) = \inf_{z | A_e z = b_e} \frac{1}{2} z^T H z + \lambda^T (A_i z - b_i)$$

$$\mathcal{L}_{inner}(z, \nu) = \frac{1}{2} z^T H z + \lambda^T (A_i z - b_i) + \nu^T (A_e z - b_e)$$

We solve the KKT system by block elimination:

$$\begin{bmatrix} H & A_e^T \\ A_e & 0 \end{bmatrix} \begin{bmatrix} z \\ \nu \end{bmatrix} = \begin{bmatrix} -A_i^T \lambda \\ b_e \end{bmatrix}$$

$$z^*(\lambda) = -H^{-1} A_e^T \left( -H_A^{-1} (b_e + A_e H^{-1} A_i^T \lambda) \right) - H^{-1} A_i^T \lambda$$

$$\lambda_{k+1} \leftarrow (\lambda_k + \alpha \nabla_{\lambda} g(\lambda_k))_+$$

## Dual Projected Gradient Algorithm

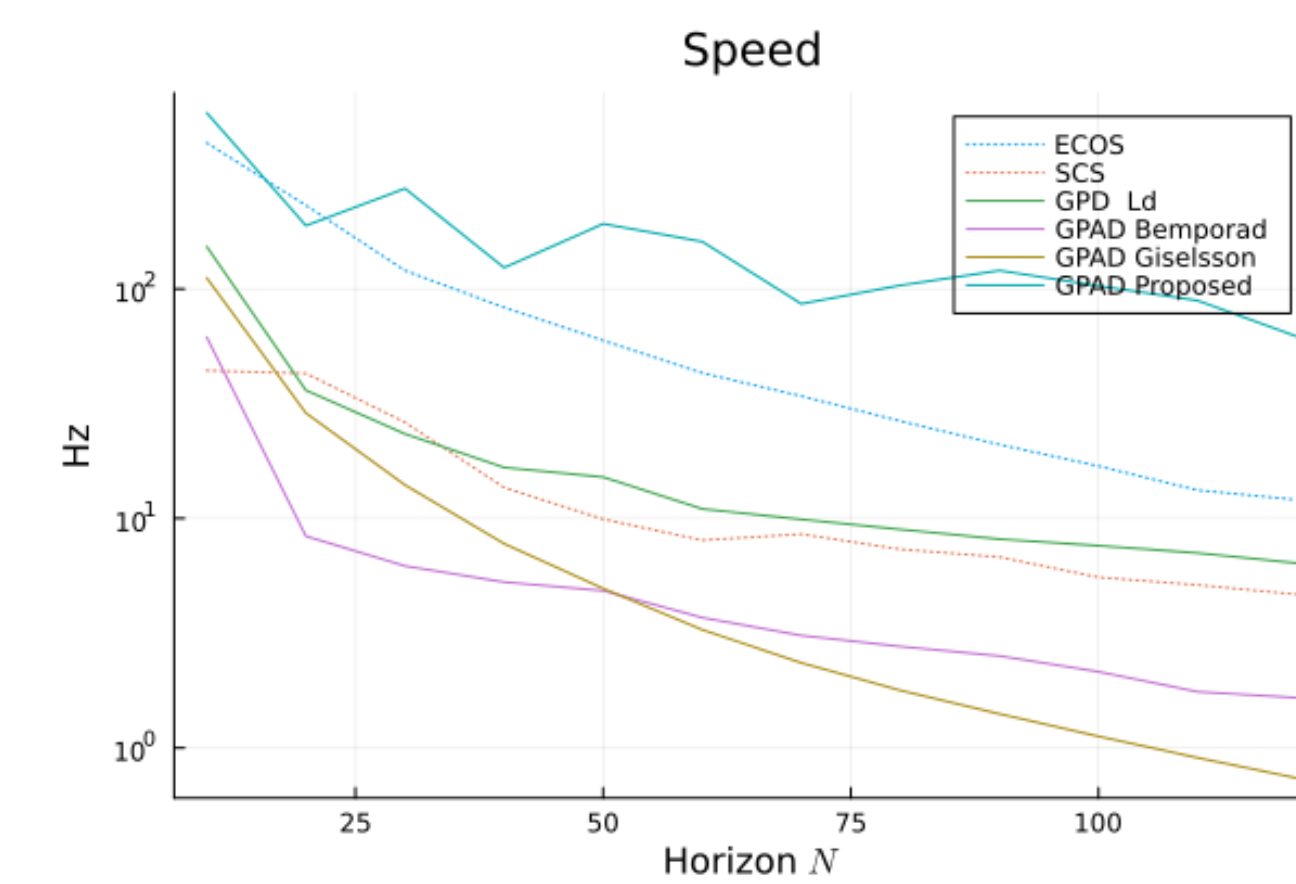

- 1: Initialize  $\lambda_0$
- 2: **for**  $k = 0$  to  $K_{\max}$  **do**
- 3:  $z_k = \arg \min_{z \in \{z | A_e z = b_e\}} L(z, \lambda_k)$
- 4:  $\lambda_{k+1} = \left( \lambda_k + \frac{1}{L} \nabla_{\lambda} L(z_k, \lambda_k) \right)_+$

## Accelerated++ Dual Projected Gradient

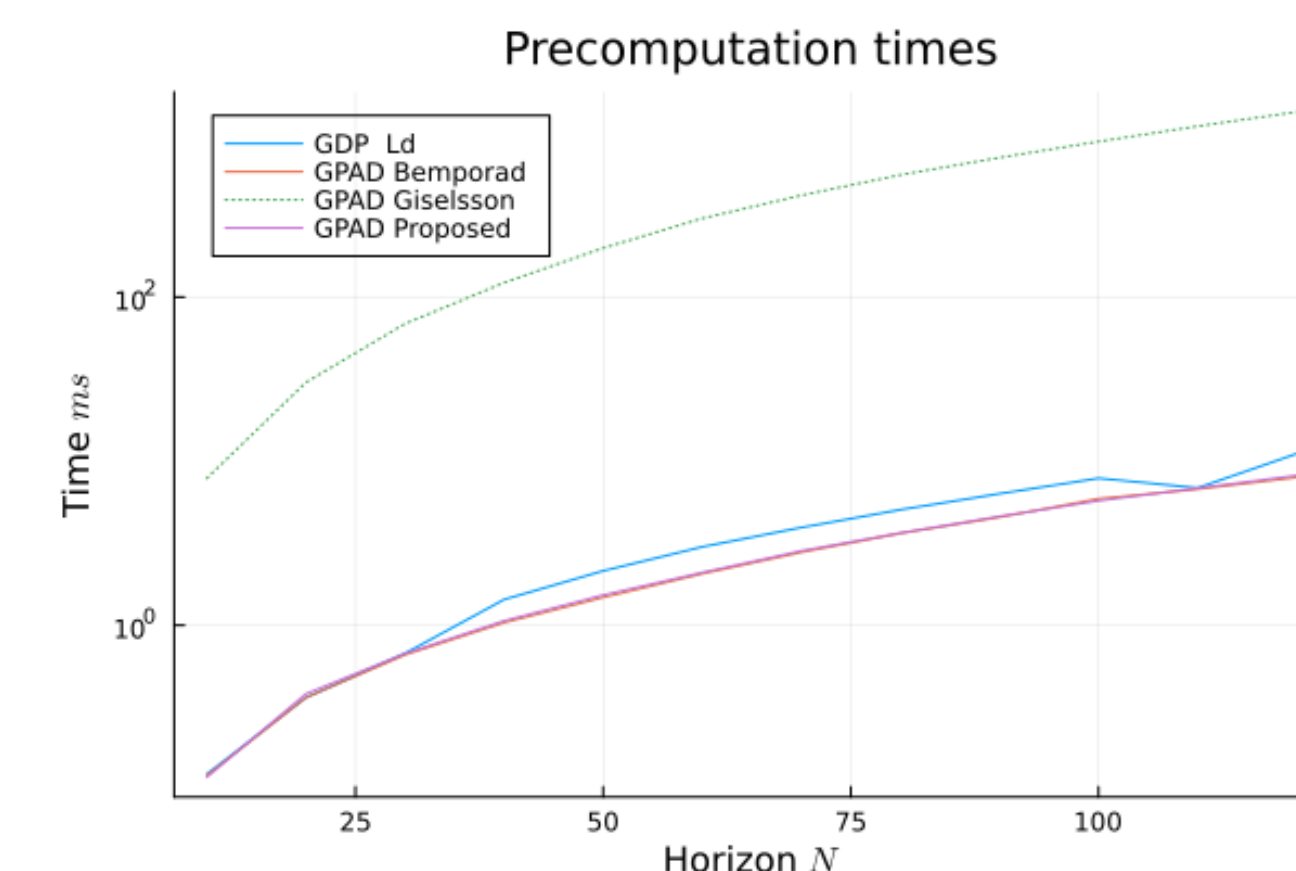

- 1: Initialize  $\lambda_0$
- 2: Initialize  $\theta_0 = \theta_{-1} = 1$
- 3: Set  $H_A = A_e H^{-1} A_e^T$
- 4: Compute  $H_A^{-1}$
- 5: Set  $Z_0 = H^{-1} A_e^T H_A^{-1} b_e$
- 6: Set  $Z_1 = H^{-1} A_e^T H_A^{-1} A_e H^{-1} A_i^T - H^{-1} A_i^T$
- 7: **Compute**  $L^{-1} = \text{diag} \left( A_i H^{-1} A_i^T \right)^{-1}$
- 8: **for**  $k = 0$  to  $K_{\max}$  **do**
- 9:  $\beta_k = \frac{\theta_k (1 - \theta_{k-1})}{\theta_{k-1}}$
- 10:  $\omega_k = \lambda_k + \beta_k (\lambda_k - \lambda_{k-1})$
- 11:  $z_k = Z_0 + Z_1 \omega_k$
- 12:  $\lambda_{k+1} = (\omega_k + L^{-1} (A_i z_k - b_i))_+$
- 13:  $\theta_{k+1} = \frac{\sqrt{\theta_k^4 + 4\theta_k^2 - \theta_k^2}}{2}$

## Experiment Results

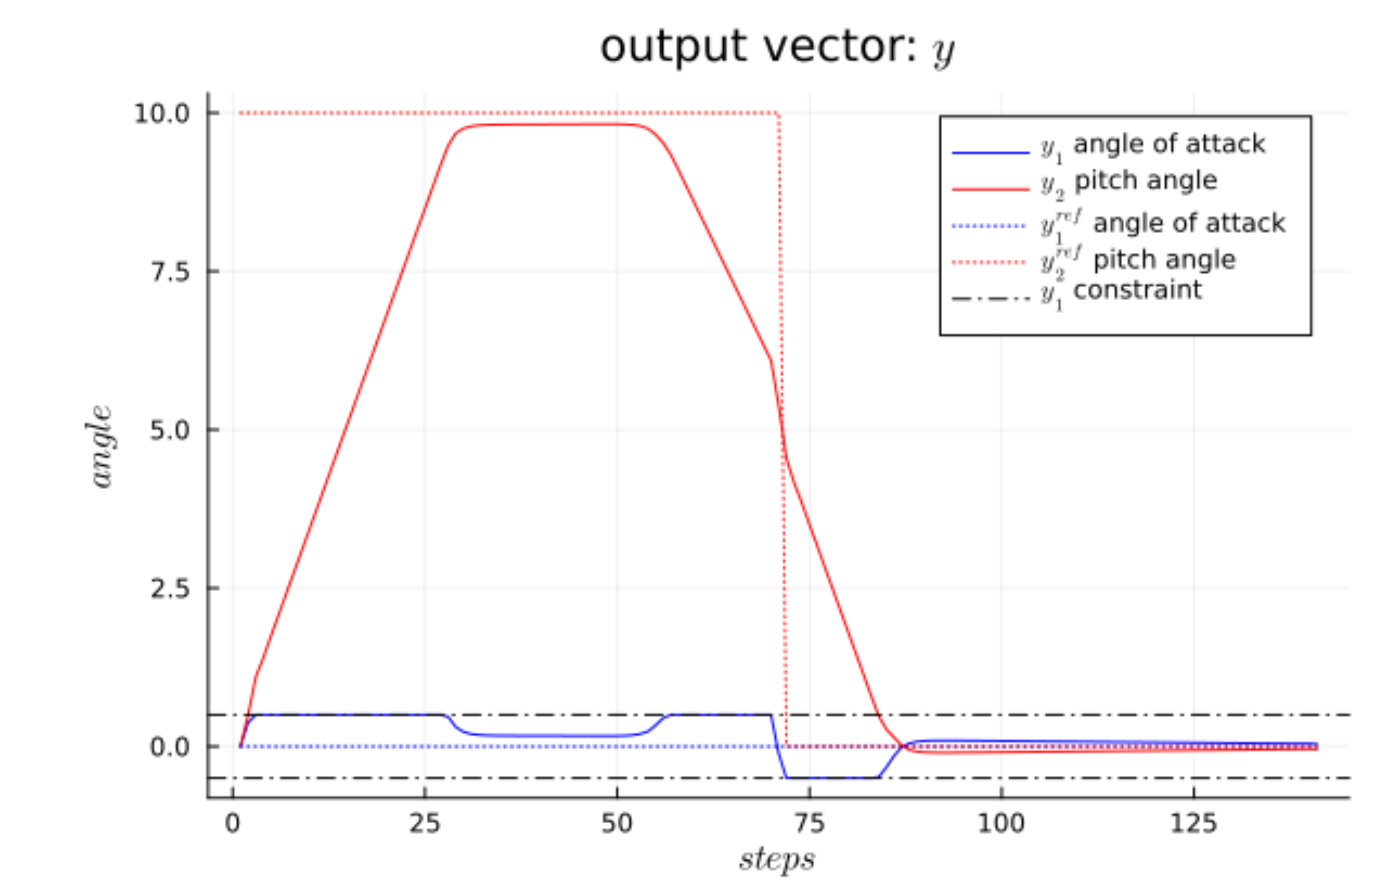

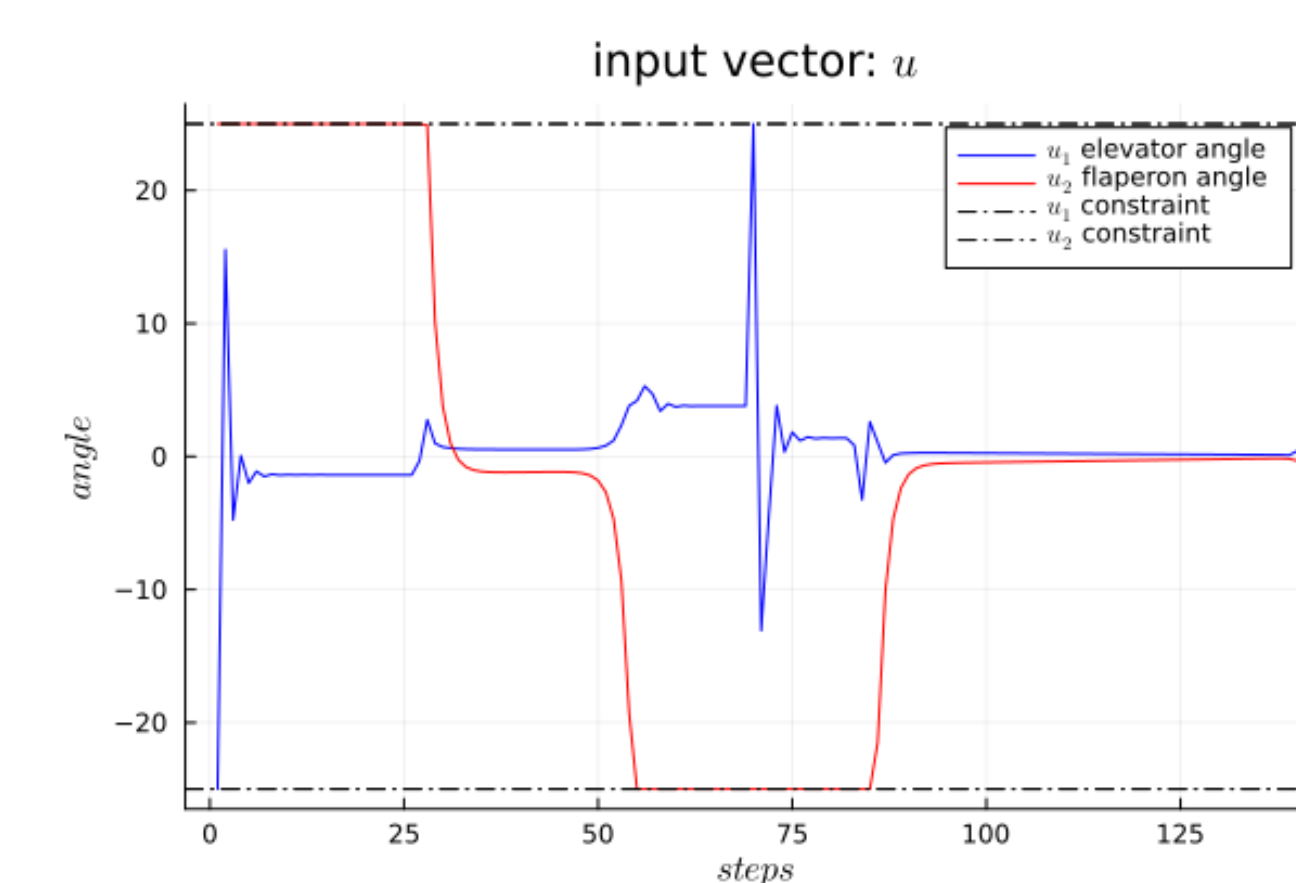

The code is written in Julia. The simulation platform uses an Intel(R) Core(TM) i9-9900K CPU @ 3.60GHz. We benchmark different GPAD algorithms with ECOS, an off-the-shell interior-point solver designed specifically for embedded applications.

We deal with a tracking problem. Vectors  $b_i, b_e$  change with every new tracking trajectory. Moreover,  $A$  and  $B$  matrices may change between subsequent MPC problem setups. They are typically linearized versions of a nonlinear model. As a consequence, the pre-computations can also be a bottleneck.

The GPAD Giselsson algorithm requires pre-computing a  $L^{-1}$  matrix by solving an SDP problem every time we update  $A$  and  $B$  matrix. This update is required in tracking problems where we repeatedly linearize nonlinear models. We propose a faster approximation of  $L^{-1}$ .

$N_{\text{horizon}}$	10	40	100	120
$(n_{\text{vars}}, m_{\text{constraints}})$	(64, 128)	(244, 488)	(604, 1208)	(724, 1448)
ECOS ms	2.3 ms	12 ms	59 ms	82 ms
GPAD* ms	1.7 ms	8 ms	10 ms	17 ms
GPAD* precomp	6%	12%	50%	50%
GPAD* iters	262	441	120	204
$f_{\text{opt}}^{\text{gp}} - f_{\text{opt}}^{\text{ecos}}$	$1e^{-7}$	$4.5e^{-5}$	$8e^{-3}$	$8e^{-3}$

## Conclusion

We derived an Accelerated Dual Projected Gradient implementation running at 588 Hz for a limited time horizon  $N = 10$  and 100 Hz for  $N = 100$ . The proposed algorithm is faster than off-the-shell Interior Point solvers like ECOS. We exploited problem structure taking advantage of sparse matrices, solved KKT by block elimination, performed pre-computations, and used acceleration methods. We update gradient with different step sizes in different directions avoiding hyper-parameter tuning thanks to a simple formula when previous publications relied on solving an SDP problem.

## Future Work

We plan to work on a custom Interior Point method.
